

OUCAI

Offline AI Assistant & Android LLM Development Platform

Semester Project

Muhammad Zalan Khan | BS Cybersecurity

BCY242024

The Problem

- LLMs run well on desktop computers
- Desktop tools for testing are mature
- Android support is still limited
- Existing Android apps mainly focus on chatting rather than development
- Running and testing local models on Android is difficult

Desktop

- ✓ Easy testing
- ✓ Multiple tools
- ✓ Good performance

Android

- ! Limited tools
- ! Difficult testing
- ! Few dev-focused apps

Introducing OUCAI

An Android application designed to bring offline Large Language Models to mobile devices — an easy-to-use interface for everyday users and a practical platform for developers testing local AI models directly on Android.

General Users

- Chat with AI completely offline
- Privacy-focused
- Easy to use

Developers

- Test LLMs
- Experiment on Android
- Improve mobile AI workflows

Project Objectives

Make offline AI accessible on Android

Remove dependency on internet connectivity

Provide a simple interface for non-technical users

Create a better testing environment for Android LLM development

Encourage mobile AI experimentation

Key Features

For Users

Offline AI conversations

Privacy-focused

Local model execution

Simple user interface

For Developers

Load and test LLMs

Evaluate model performance

Faster experimentation on Android

Development-friendly environment

One platform serving both users and developers.

Future Scope

Possible future improvements

Support for more LLM formats

AI agents

Document understanding

Plugin ecosystem

Performance optimization

Voice interaction

Image capabilities

Cross-device synchronization

Conclusion

Bringing powerful offline AI to Android for both everyday users and developers.

Thank You
